

## **ANALISIS KETERLIBATAN WANITA TANI TERHADAP PENDAPATAN USAHATANI PADI SAWAH DI KABUPATEN BANGKALAN**

### **ABSTRAK**

Wanita dalam kegiatan usahatani memiliki peran yang saling melengkapi dengan pria, namun seringkali dianggap sebelah mata. Wanita dianggap tidak memberikan dampak yang signifikan dalam kegiatan usahatani. Penelitian ini bertujuan untuk menganalisis tingkat keterlibatan wanita tani serta hubungannya dengan pendapatan usahatani padi sawah di Kabupaten Bangkalan, khususnya di Desa Sabiyan. Penelitian ini menggunakan metode kuantitatif dengan teknik pengambilan sampel jenuh sebanyak 45 responden wanita tani. Data dikumpulkan melalui observasi, wawancara, dan dokumentasi, serta dianalisis menggunakan metode deskriptif dan uji Chi-Square untuk melihat hubungan antara tingkat keterlibatan wanita tani dengan pendapatan usahatani. Hasil penelitian menunjukkan bahwa wanita tani terlibat dalam seluruh aktivitas usahatani, meliputi produksi, akses, kontrol, dan manfaat, meskipun tingkat keterlibatan pada setiap aspek berbeda. Keterlibatan tertinggi terdapat pada aktivitas penanaman bibit dan akses terhadap fasilitas pertanian. Namun, hasil uji menunjukkan bahwa keterlibatan wanita tani tidak memiliki hubungan signifikan terhadap pendapatan usahatani padi sawah. Hal ini menandakan bahwa meskipun wanita tani berperan penting dalam proses pertanian, kontribusinya belum berdampak langsung terhadap peningkatan pendapatan. Oleh karena itu, diperlukan peningkatan pelatihan, akses informasi, dan kesempatan bagi wanita tani untuk berperan dalam pengambilan keputusan strategis di bidang pertanian.

**Kata Kunci:** wanita tani, keterlibatan, pendapatan, usahatani padi, Bangkalan

## **ANALYSIS OF WOMEN FARMERS' INVOLVEMENT IN RICE FARMING INCOME IN BANGKALAN DISTRICT**

### **ABSTRACT**

*Women complementary roles to men in farming activities. however, their contributions are often underestimated. This study aims to analyze the level of women farmers' involvement and its relationship with rice farming income in Bangkalan Regency, particularly in Sabiyan Village. A quantitative approach was*

*employed using a saturated sampling technique involving 45 women farmers. Data were collected through observation, interviews, and documentation, and analyzed using descriptive analysis and the Chi-Square test. The results indicate that women farmers are involved in all farming activities, including production, access, control, and benefits, although the level of involvement varies across aspects. The highest involvement is found in seedling and planting activities as well as access to agricultural facilities. However, statistical analysis shows that women farmers' involvement does not have a significant relationship with rice farming income. This finding suggests that although women farmers play an important role in agricultural activities, their contributions have not yet directly affected income levels. Therefore, efforts to enhance training, information access, and decision-making opportunities for women farmers are necessary to strengthen their role in agricultural development.*
